Crochet Application

Topic (short, descriptive name of your topic)

Crochet app (final name to be determined)

Short description (give brief introduction about your project):

The goal of our project is to create a React-based service destined to people that crochet. The service would include a database of crochet stitches, with instructions, detail of techniques used, pictures and diagrams. The user would be able to look through the database and would also have access to a row (and stitch) counter, which is a relevant tool to keep track of progress within a project. The user would be able to connect to an account to save their favorite stitches and also their row count on multiple projects.

Technologies

- Node
- Express JS
- React
- MongoDB
- Docker for the deployment
